Matrix:

Legacy to Cloud-Native Platform Transition

Problem:

Matrix Medical's legacy infrastructure, hosted on outdated physical hardware, suffered from chronic downtime, costly maintenance, compliance vulnerabilities, and poor scalability. The rigid architecture severely hindered rapid innovation, clinician productivity, patient experience, and the company's competitiveness with healthcare insurance partners—jeopardizing long-term strategic goals and impending private equity plans for company sale.

Action:

Partnered with Chief Architect and CIO to lead a comprehensive modernization effort, migrating from legacy hardware to a cloud-native infrastructure built around Azure, Kubernetes (OpenShift), and Terraform. Directed the architectural redesign, reorganized fragmented engineering teams, introduced rigorous agile practices, robust DevSecOps pipelines, and advanced test automation. Maintained close alignment and transparency through structured daily, weekly, and monthly communications across internal teams, external partners, and senior leadership.

Result:

Delivered substantial operational improvements, including over 75% reduction in downtime, enhanced clinician experience, and dramatically increased deployment velocity through full CI/CD capability. Achieved 40–50% reduction in operational costs via optimized cloud infrastructure, streamlined team structure, and

elimination of redundant support contracts. Enhanced compliance posture through automated real-time DevSecOps audits, significantly decreasing risk. Positioned Matrix strategically for improved partner responsiveness and competitive market positioning, aligning directly with board and private equity-driven strategic objectives.

PAD IoT Integration (Matrix Medical Network)

Problem:

Matrix faced compliance and billing accuracy challenges because nurse practitioners manually entered Peripheral Arterial Disease (PAD) test results from third-party medical devices (Semler Scientific). Manual data entry led to frequent discrepancies between actual device results and clinician-entered results, creating significant compliance risks, billing inaccuracies, and potential adverse patient-care outcomes. Matrix's primary client, Humana, mandated remediation, as Matrix's primary competitor had already addressed this compliance gap.

Action:

I oversaw the technical design and delivery of an automated, real-time integration solution. My team leveraged **Mirth Connect** (NextGen Healthcare's robust healthcare integration engine supporting HL7 and FHIR standards) to build seamless interoperability between Semler's PAD diagnostic devices and Matrix's clinical workflow application. Under my leadership, we established a real-time, bi-directional data-exchange workflow: when clinicians initiated PAD tests, results automatically flowed via Mirth Connect from Semler's system directly back into Matrix's app for clinician review, validation, and approval. I coordinated closely with Semler Scientific, internal developers, and compliance stakeholders to ensure successful and compliant implementation.

Result:

The new automated workflow virtually eliminated manual data-entry errors, fully remediating previously significant compliance risks and billing inaccuracies. Real-time integration measurably enhanced clinician efficiency, significantly improved patient-care data accuracy, and ensured adherence to strict regulatory requirements. Additionally, this integration established essential infrastructure and

workflows that were later leveraged for Matrix's next-generation clinical application development.

Engineering Org Consolidation & Agile Transformation (Matrix Medical Network)

Problem:

Matrix's engineering organization was severely fragmented across 11 separate teams—including 63 internal engineers, 26 contractors, and approximately 40 offshore engineers—operating under multiple restrictive NDAs. Teams were project-focused, deeply siloed, lacked clear ownership or autonomy, and had limited understanding of customer needs, leading to poor prioritization, constant dependency bottlenecks, inefficient scheduling, slow monthly waterfall releases, frequent production outages, low-quality deliverables, persistent compliance risks, increased operational costs, internal frustration, poor morale, and negative customer and stakeholder feedback.

Action:

I personally designed and executed an extensive Agile transformation and organizational restructuring, consolidating these fragmented 11 teams into four clearly defined, autonomous, customer-centric Agile squads:

- **Provider Experience Squad:** Owned clinician workflows, clinical applications, and scheduling.
- **Patient Experience Squad:** Managed patient engagement, scheduling, and outreach.
- **Carrier Experience Squad:** Focused on integrations, eligibility workflows, and data exchange with insurance providers.
- **Data Squad:** Cross-functional team providing embedded data engineering, compliance, analytics, and reporting support to each of the other squads.

I directly introduced rigorous Agile methodologies, provided extensive Agile coaching, embedded QA and DevOps resources within each squad, ensured cross-team collaboration, and facilitated modern continuous integration and

continuous delivery (CI/CD) processes. Critical data engineering and QA resources, although maintaining their functional teams, were embedded and integrated directly into the product-focused squads for maximum agility and autonomy. I actively engaged executive leadership and the board to secure necessary buy-in, manage complex dependencies (particularly with offshore teams), and ensure strategic alignment, unknowingly laying critical groundwork for future initiatives.

Result:

The reorganization delivered immediate, measurable benefits, significantly accelerating release velocity, drastically reducing outages and escalations, sharply cutting infrastructure and staffing costs, and improving product quality and compliance. Clearer ownership and embedded cross-functional resources dramatically increased team efficiency and autonomy.

Morale improved significantly, as engineering teams enthusiastically embraced a clearer sense of purpose, autonomy, and direct customer engagement—addressing longstanding internal requests. Crucially, although unknown at the outset, this agile restructuring directly enabled subsequent strategic initiatives: the rapid and successful offboarding of 26 contractors and the seamless rebadging of 63 internal engineers to an offshore vendor. The newly streamlined, agile structure significantly accelerated these transitions, directly supporting Matrix's broader strategic objectives.

Contractor Knowledge Transfer & Rapid Offboarding (Matrix Medical Network)

Problem:

Matrix faced a critical operational and financial challenge: 26 essential contractor engineers, including all principal engineers and the chief architect, were scheduled to roll off within 30 days after already being previously extended. The internal team of 63 engineers was entirely unaware of, and lacked critical knowledge regarding, the newly developed platform due to restrictive NDAs and significant skill gaps. With the entire engineering organization fully remote, traditional face-to-face knowledge transfer was not feasible, compounding the

risks of knowledge loss, compliance issues, operational disruption, and delayed delivery.

Action:

I personally spearheaded an intensive, fully remote knowledge-transfer initiative, rapidly coordinating over 90 hours of virtual, group-based video sessions to capture critical engineering expertise. Leveraging external AI applications alongside custom-built AI solutions, I meticulously documented all session content—videos, transcripts, decks, presentations, and summaries—creating a fully searchable, GPT-enabled knowledge base integrated into Confluence. This innovative solution enabled precise video indexing, timestamped searchability, and AI-driven query responses. Supplemental remote, hands-on training further accelerated effective onboarding.

Result:

We successfully completed comprehensive knowledge transfer, smoothly offboarding all 26 contractor engineers within the stringent 30-day deadline, significantly reducing operational risk and realizing substantial cost savings. Leveraging these AI-driven tools exceeded expectations, reducing anticipated productivity loss and churn dramatically. The internal legacy team took ownership of the new platform far faster than anticipated, with no downtime or major issues arising during the transition. This living, remote-friendly knowledge base continued providing immense value beyond immediate needs, significantly enhancing future onboarding efficiency and ensuring long-term operational continuity and stability.

Employee Rebadging to Offshore Vendor (Matrix Medical Network)

Problem:

Matrix strategically decided, in partnership with third-party development firm Pier Islands, to rebadge their entire internal engineering team (63 engineers) to Pier Islands. This move was primarily driven by Matrix's urgent need to significantly reduce operating expenses (OPEX) in preparation for a private-equity-driven transaction, coupled with Pier Islands' strategic need to rapidly expand its

engineering capacity. The complexity involved substantial logistical, technical, and personnel-related challenges, including significant differences in tech stacks and the critical need to preserve operational continuity.

Action:

I directly led the comprehensive rebadging initiative, including detailed needs assessments and creating individualized knowledge-transfer and training plans tailored to each of the 63 transitioning engineers, addressing significant technology-stack gaps between Matrix and Pier Islands. I managed all logistical complexities, including critical H1B visa coordination, while proactively communicating with stakeholders—Matrix executives, Pier Islands leadership, and affected engineers. Additionally, I provided personal guidance and supportive communication to each engineer to help them make informed, strategic, non-emotional decisions beneficial to their career growth, all while ensuring uninterrupted operational continuity throughout the transition.

Result:

The rebadging was highly successful, with 61 of 63 engineers smoothly and willingly transitioning to Pier Islands, fully realizing Matrix's intended OPEX reductions. There were no significant disruptions in project timelines or operational continuity, validating the effectiveness of the meticulous transition planning and communication strategy. Pier Islands significantly expanded its engineering capacity, while Matrix smoothly transitioned its engineering operations. Ultimately, this initiative also enabled a clean and efficient leadership handoff to three newly hired Matrix VPs, facilitating my own successful and well-managed exit from the organization at the conclusion of the project.

EHR Clinical Coding Platform Outsourcing (Matrix Medical Network)

Problem:

Matrix Medical Network faced significant operational and compliance challenges related to clinical documentation and diagnostic coding. Initial efforts to outsource coding processes to the AI-driven *evaire* platform from ECLAT Health Solutions were problematic, resulting in integration difficulties, compliance gaps, inefficient

workflows, and increased audit exposure—impacting the quality of patient care reporting, regulatory standing, and operational costs.

Action:

I was brought in specifically to resolve and remediate the significant issues that emerged during the initial integration and implementation of evaire. I personally led a detailed remediation plan that included redesigning and clarifying API integrations, refining and optimizing coding workflows, rigorously enforcing compliance oversight, and resetting stakeholder expectations through clear, consistent communication. My efforts ensured smooth operational and cultural alignment with the evaire platform, stabilizing the implementation and turning around the previously struggling initiative.

Result:

My targeted intervention rapidly improved clinical coding accuracy and fully remediated compliance risks, significantly reducing exposure to audit issues. Workflow efficiencies and operational scalability markedly improved, driving substantial coding-related cost reductions. The turnaround effort provided a stable foundation, enabling Matrix to effectively leverage evaire's AI capabilities, real-time educational feedback, and analytics for continuous improvement. Ultimately, my leadership in addressing and resolving these critical issues reinforced Matrix's reputation as an industry leader in clinical documentation, elevated client satisfaction, and directly enhanced patient outcomes and provider reimbursements.

Clinician Scheduling & Patient Logistics Platform (Matrix Medical Network)

Problem:

Matrix Medical faced significant competitive disadvantages due to an outdated clinician scheduling and patient logistics system. Operational inefficiencies led to frequent cancellations, missed appointments, poor patient satisfaction, and extremely high clinician dissatisfaction. Matrix was losing scheduling opportunities and eligible patient visits to competitors who offered better, more flexible scheduling experiences and efficient appointment management. The

platform was unable to manage dynamic scheduling needs, route optimization, and state-by-state task-oriented compliance requirements, directly impacting Matrix's market competitiveness.

Action:

I directly led the strategic effort to design and build a highly advanced, "Uber-like" scheduling and logistics platform. The solution leveraged geo-targeting, dynamic routing, and flexible scheduling tools to optimize nurse practitioner assignments and travel routes. It allowed for real-time rerouting and float capacity management to efficiently handle cancellations and rescheduling. We incorporated compliance-driven scheduling constraints, addressing specific state-by-state work regulations. The platform also provided advanced outreach capabilities for operations—including cohort targeting, SMS and in-app messaging—with robust privacy and security compliance.

Result:

The implementation dramatically enhanced Matrix's competitive positioning, significantly improving both clinician and patient satisfaction. Operational efficiencies sharply improved, including a 30% increase in daily clinician assessments due to better scheduling accuracy and route optimization. Matrix experienced significantly reduced operational costs, greater scheduling flexibility, improved patient engagement, and enhanced clinician productivity. Ultimately, the project delivered meaningful operational and financial benefits, repositioning Matrix Medical Network ahead of industry competitors.

Humana API Interface Rebuild & Enhancement (Matrix Medical Network)

Problem:

Humana, Matrix Medical Network's largest client, required a rapid and comprehensive rebuild of their API interface within a tight 30-day deadline. The updated API impacted critical assessment data flows, and Matrix initially believed meeting the aggressive timeline was impossible, posing a major risk of operational disruption and client dissatisfaction.

Action:

I personally stepped in and led the rapid API rebuild effort, working closely alongside a single senior engineer. I coordinated directly with Humana's engineering team, quickly identifying and validating new endpoints and interface requirements. We swiftly created a dedicated development and QA environment, mapped all assessment inputs and outputs to Humana's new API endpoints, performed rigorous testing collaboratively with Humana, and managed stakeholder expectations proactively throughout the accelerated project timeline.

Result:

The API rebuild was completed successfully and deployed five days ahead of schedule, significantly exceeding initial expectations. Operational continuity was fully maintained with zero disruption. This rapid response strengthened Matrix's relationship with Humana, reinforced client trust and satisfaction, and demonstrated Matrix's agile capability to rapidly respond to complex integration requirements.

HITRUST Compliance & Audit Management (Matrix Medical Network)

(Ongoing Quarterly Responsibility)

Problem:

Matrix Medical Network operates within a highly regulated healthcare environment requiring consistent, rigorous compliance with HITRUST standards. Frequent regulatory audits posed ongoing risks related to data security, privacy, and operational compliance. Without proactive leadership and meticulous preparation, Matrix risked compliance failures, audit findings, penalties, and potential reputational damage.

Action:

As an ongoing quarterly responsibility, I personally led Matrix's HITRUST audit readiness initiatives. This involved continuous oversight of internal workflow and asset assessments, coordinating detailed compliance remediation activities, ensuring documentation rigor, and maintaining frequent and transparent

communication with stakeholders to set and meet compliance expectations. My proactive leadership and continuous improvement efforts ensured audit readiness and consistent alignment with evolving regulatory requirements.

Result:

Under my leadership, Matrix consistently achieved successful HITRUST audits, maintaining a robust compliance posture. Regular audit preparation and oversight significantly reduced compliance-related risks, audit findings, and operational disruptions. Stakeholder confidence increased substantially due to predictable, transparent compliance management. Ultimately, my ongoing compliance leadership preserved Matrix's reputation, reduced risk exposure, and ensured operational continuity within the complex healthcare regulatory environment.

Whitepages

Platform & Organizational Rebuild (Whitepages Inc.)

Problem:

Whitepages Inc. faced critical business and technical challenges following its split from Ekata (formerly Whitepages Pro, B2B). Ekata retained most of the original engineering talent, product teams, and technology assets, leaving Whitepages with outdated Ruby (11-year-old monolith) and Python platforms burdened by severe technical debt, scalability constraints, operational inefficiencies, and reliability issues. Whitepages urgently needed a comprehensive technology re-platforming and an organizational rebuild (engineering, QA, SRE, and product teams) within an aggressive 18-month technology lease-back period. I joined Whitepages in September 2019—less than six months before the onset of COVID-19, adding unforeseen operational complexity.

Action:

As VP of Engineering & Data Strategy, I led a rapid and comprehensive transformation that addressed both technology and organizational gaps. My team successfully transitioned the legacy Ruby and Python monolithic platforms into scalable, cloud-native microservices architectures, performing a complex, zero-

downtime cutover. In parallel, I rebuilt and expanded the engineering, QA, SRE, and product teams by 170%, creating a robust, agile-driven organization spanning North and South America. Additionally, I implemented GDPR and CCPA compliance frameworks, safeguarding more than 300 million user records. This intensive organizational rebuild and re-platforming was executed under the additional challenges posed by the sudden shift to fully remote operations due to COVID-19.

Result:

The transformation resulted in substantial business outcomes, notably a 32% reduction in operational expenses and a more than 45% improvement in platform search relevance driven by optimized data assets and algorithms. Machine learning integration significantly boosted marketing conversions by 82%, unlocking new revenue streams. The rebuilt teams greatly improved delivery velocity, platform reliability, and scalability, effectively positioning Whitepages for sustained competitive growth and innovation despite the extraordinary challenges of the global pandemic.

Data Privacy & Fraud Prevention Product (Whitepages Inc.)

Problem:

Whitepages recognized increasing threats posed by bad actors who leveraged publicly available data to compile comprehensive identity profiles (“fullz”), facilitating fraud and identity theft. Fraudsters frequently exploited platforms like Whitepages, LinkedIn, and Facebook to gather sensitive personal data such as addresses, relatives, and other identifiers. Additionally, evolving regulatory environments demanded proactive efforts in data protection, while competitive market pressures required differentiation in privacy and fraud prevention.

Action:

In my role overseeing Product, Engineering, and Data Strategy, I spearheaded the strategic development and launch of a Data Privacy & Fraud Prevention product. We leveraged advanced machine learning to analyze real-time user behavior patterns on the platform, identifying suspicious activity indicative of fraud

attempts. This included unusual traffic spikes, repeated searches, multiple locations, and anomalous profile interactions. Integrating third-party breach and risk data, we proactively identified and monitored consumers at higher risk of data compromise. My team developed automated detection triggers, provided immediate alerts, and delivered clear remediation recommendations directly to affected users.

Result:

The product significantly enhanced Whitepages' capacity to identify and mitigate fraudulent behavior daily. Consumers received timely, actionable alerts about suspicious activity involving their personal data, greatly improving customer trust and satisfaction. Strategically, this positioned Whitepages as a leader in proactive data privacy and fraud prevention, demonstrating regulatory compliance, reducing overall risk exposure, and creating clear competitive differentiation. Additionally, the product established foundational capabilities supporting future expansions into broader identity protection markets, positioning Whitepages alongside industry leaders in data security and privacy protection.

ML-Driven Conversion & Personalization Platform (Whitepages Inc.)

Problem:

As a leading data and search provider, Whitepages primarily monetized web traffic through conversions from free to premium services and advertising revenue. With advertising revenue declining industry-wide, Whitepages sought new strategic opportunities to significantly boost conversion rates and revenue streams as part of their major platform redevelopment initiative. This wasn't due to failing performance, but rather proactive recognition of opportunities to enhance user personalization, conversion effectiveness, and overall customer engagement during the platform rebuild.

Action:

In my role as VP of Engineering & Data Strategy, I strategically spearheaded the development of an advanced machine learning-driven platform directly embedded within our re-platformed business intelligence and product ecosystem. My team

integrated sophisticated ML models designed to enhance hyper-personalized user experiences and significantly improve marketing campaign targeting and effectiveness. I coordinated closely with engineering, product, data science, and marketing teams, ensuring seamless alignment, technical integration, and effective operational execution of this strategic initiative .

Result:

The ML-driven personalization and conversion solution resulted in an impressive 82% increase in conversion rates from free users to premium subscribers, creating substantial new revenue streams at a critical time of declining ad revenue. Additionally, enhanced personalization dramatically improved customer engagement, satisfaction, and retention. Operationally, the platform delivered significantly improved marketing effectiveness, robust campaign management capabilities, and further strengthened Whitepages' competitive positioning as a market leader in data-driven consumer services .

Real Estate and Business Data Services Product (Whitepages Inc.)

Problem:

Whitepages identified significant opportunities to expand revenue streams and increase platform retention ("stickiness") by addressing high demand from real estate and business users—its heaviest consumer segments. These business users frequently sought customized, real-time, and segmented data streams (geographic regions, specific user cohorts, targeted consumer profiles). Whitepages lacked a tailored solution, limiting its ability to fully capitalize on this critical market segment and retain high-value customers long-term.

Action:

In my role overseeing Product and Engineering, I led strategic ideation, roadmap creation, and successful execution of a dedicated Real Estate and Business Data Services product. My team developed a robust, flexible data solution enabling business users to create customized data streams feeding directly into their own internal systems (CRMs) or embedded within Whitepages platforms. This provided real-time, ongoing updates to customer-selected consumer cohorts or geographic

data segments, significantly enhancing data usability and business effectiveness. The entire product strategy originated from targeted business ideation, closely aligned with market needs, and executed through coordinated product, engineering, and data collaboration.

Result:

We successfully launched a new revenue-generating business product, significantly increasing client adoption among high-value business and real estate users. The product substantially enhanced customer retention and platform "stickiness," with users becoming reliant on real-time, tailored data streams integral to their daily operations. Client satisfaction notably improved due to the tailored nature and timeliness of the service, creating strong long-term strategic relationships and competitive differentiation. This ideation-driven initiative delivered measurable revenue growth, significantly enhanced strategic positioning, and strengthened Whitepages' reputation as a premier data service provider.

COVID-19 Emergency Contact & Outreach Product (Whitepages Inc.)

Problem:

The COVID-19 pandemic dramatically increased demand for accurate, timely outreach to next-of-kin and family members, particularly among healthcare providers, hospitals, law enforcement, wellness centers, and emergency responders. Whitepages observed a sharp surge in traffic from organizations urgently needing reliable contact data to support critical healthcare communications, often involving life-or-death situations.

Action:

As VP of Engineering & Data Strategy, I rapidly led the ideation, creation, and deployment of an emergency-response-focused bundle of products specifically tailored for healthcare networks, hospitals, wellness centers, and law enforcement. We offered these essential data outreach services free of charge, empowering organizations to quickly and accurately connect with individuals and their families during the health crisis. This initiative required swift cross-team

collaboration, rapid technical implementation, and extensive stakeholder engagement under intense pressure and accelerated timelines.

Result:

Our initiative provided critical, life-saving assistance precisely when it was needed most, significantly aiding healthcare providers, emergency services, and wellness centers in connecting with affected families and individuals. This rapid, socially responsible product innovation substantially enhanced Whitepages' community reputation and demonstrated strong organizational agility, responsiveness, and commitment to social responsibility during an unprecedented global crisis.

ReachNow (BMW)

Mobility Platform Rebuild & IoT API Gateway Development (ReachNow – BMW Group)

Problem:

ReachNow initially launched with severe operational and technical challenges due to outsourcing critical technology components to a third-party vendor. Significant limitations with IoT hardware in vehicles, combined with poor mobile app functionality and inadequate platform stability, resulted in extensive operational disruptions. Roughly 1 in 7 reservations required customer support, nearly half necessitating tow trucks, causing extremely low customer satisfaction and operational inefficiencies. These challenges severely impacted BMW's confidence in the initiative and limited ReachNow's growth potential.

Action:

As the technology and product leader, I worked closely with BMW executives in Munich, successfully securing approval and funding to internally redevelop our core mobility platform. Recognizing hardware constraints (six-year IoT device lifecycle), I strategically developed and deployed an innovative API Gateway as an intermediary solution between vehicle IoT units and our mobile app. This gateway enabled API injection, allowing full remote functionality management despite hardware limitations. Concurrently, I built a skilled internal technology team in

Seattle and Munich, while also maintaining and strategically collaborating with the original third-party vendor to ensure continuity and a smooth transition to internal control.

Result:

The platform rebuild and IoT API Gateway significantly improved operational stability and customer experience. Customer support calls dropped dramatically from approximately 1 in 7 reservations to fewer than 1 in 32. Customer satisfaction and NPS scores improved substantially within six months, reflecting meaningful enhancements in reliability and overall service quality. Crucially, this successful turnaround reinforced BMW executive confidence, resulting in increased strategic investment and positioning ReachNow as a trusted innovation hub. Ultimately, the project laid the critical foundation enabling ReachNow's pivotal role in BMW's global mobility joint venture strategy.

Mobile App Redevelopment & User Experience Transformation (ReachNow – BMW Group)

Problem:

ReachNow faced severe challenges due to poorly developed mobile applications from a third-party vendor, resulting in disastrous customer experiences, low functionality, and significant operational disruptions. User satisfaction was exceptionally low, with iOS app ratings at approximately 1.4 and Android ratings even lower. The existing apps limited the ability of internal operations, third-party fleet management, and backend services to effectively manage fleet activities and restricted the rollout of critical new functionalities, severely hampering ReachNow's business growth and customer retention.

Action:

In my leadership role, I worked intensively with BMW executives in Munich, successfully securing rapid approval for a complete app redevelopment initiative. To immediately begin redesigning, I brought in a specialized third-party design firm and led cross-functional teams (product, engineering, design, operations) through a comprehensive "soup-to-nuts" overhaul of the mobile application's user

experience, product requirements, technical architecture, and backend integrations.

Given aggressive timelines, I strategically partnered with the existing third-party app developer to maintain continuity. Simultaneously, I rapidly built an internal mobile development team, embedding these new internal developers within the third-party team for effective knowledge transfer. Approximately three-quarters of the way through development, we fully transitioned app development in-house—temporarily embedding the third-party developers directly within my team to complete the transition smoothly.

Result:

The relaunched ReachNow mobile app dramatically improved customer experience and satisfaction, debuting with an exceptional iOS App Store rating of 4.8 (and maintaining a strong 4.7 rating one year later). Android ratings improved comparably, reaching near 5-star performance. Customer support calls dropped significantly, reflecting vastly improved app reliability and operational efficiency. Crucially, this comprehensive redevelopment removed prior technology constraints, allowing rapid introduction of critical new features and capabilities that had previously been impossible to implement. Additionally, this redevelopment served as the technical backbone for ReachNow's new operations platform initiative and significantly reinforced BMW executive and investor confidence, strategically positioning ReachNow as the trusted technology hub within BMW's global mobility joint venture strategy.

ML-Powered Fleet Operations Optimization (ReachNow – BMW Group)

Problem:

ReachNow's free-floating car-sharing service faced substantial operational inefficiencies and high fleet management costs driven by uneven vehicle distribution across urban locations, inefficient vehicle repositioning, excessive manual interventions, and unpredictable maintenance and fueling schedules. During peak commuter hours, fleet vehicles frequently clustered in high-density areas (e.g., downtown city centers) while other areas remained underserved,

resulting in underutilized vehicles, increased repositioning costs, poor operational efficiency, and diminished customer satisfaction.

Action:

As the strategic leader, I spearheaded a machine learning-driven fleet optimization initiative. My team developed advanced ML models that accurately predicted optimal vehicle distribution and repositioning requirements based on historical usage patterns and real-time telemetry data from IoT sensors embedded in the fleet. We introduced customer incentive campaigns, leveraging targeted discounts and promotions, encouraging users to reposition vehicles naturally, significantly reducing reliance on manual repositioning.

Additionally, predictive ML algorithms proactively forecasted fueling needs and vehicle maintenance schedules, dramatically enhancing operational efficiency and minimizing vehicle downtime. Close collaboration was ensured between internal teams, third-party fleet management providers, operations, and marketing to execute seamlessly integrated campaigns and operational adjustments.

Result:

This ML-powered optimization delivered remarkable operational improvements, including a **67% reduction in fleet management costs** and a **9% increase in monthly revenue per vehicle**. Predictive repositioning significantly reduced costly manual fleet movements, maximizing vehicle utilization and efficiency. Customer incentive campaigns proved highly effective in balancing fleet distribution. Predictive maintenance and fueling schedules further reduced downtime and operational disruptions. Collectively, these initiatives resulted in heightened customer satisfaction, improved reliability, increased fleet scalability, and reinforced BMW executive confidence, clearly demonstrating ReachNow's leadership in operational innovation.

Cybersecurity & Fraud Prevention Enhancement (ReachNow – BMW Group)

Problem:

Upon launching in Brooklyn, ReachNow experienced an unprecedented surge in fraud and vehicle theft. Within the first week alone, nearly 40 high-value BMW vehicles were stolen or compromised due to fraudulent identity validation during user onboarding. Existing third-party validation services failed to adequately detect fake or reused IDs, allowing multiple fraudulent account creations and enabling widespread theft and operational disruptions. The resulting retrieval efforts, damage costs, and reputational harm posed significant financial and strategic risks.

Action:

To rapidly resolve this critical issue, I led strategic initiatives to overhaul and significantly enhance our cybersecurity and fraud prevention framework. My team implemented an advanced risk-assessment and identity-validation solution by integrating a new third-party cybersecurity and risk management provider ("Kount"). This service performed real-time trust scoring, bot detection, duplicate account identification, and comprehensive fraud-risk analytics during the user onboarding process. I worked closely with internal security teams, operations stakeholders, and the vendor to ensure seamless integration, customization, and real-time security improvements, while maintaining high user acceptance rates.

Result:

Our enhanced cybersecurity measures dramatically reduced vehicle theft incidents and fraud, effectively eliminating the severe security and financial vulnerabilities initially experienced during market entry. Operational costs related to vehicle recovery and damage significantly decreased, improving overall fleet security and customer trust. Customer onboarding remained frictionless, with an extremely low legitimate-user decline rate. Strategically, this initiative not only stabilized ReachNow's operations but also provided a robust, scalable cybersecurity framework adopted as a best practice model across other BMW divisions facing similar challenges—significantly enhancing BMW executives' confidence in our security posture and operational leadership.

Strategic Leadership for BMW/Daimler Joint Venture Platform (ReachNow – BMW Group)

Problem:

BMW and Daimler sought to combine their global mobility offerings through an ambitious joint venture involving nine distinct mobility subsidiaries, including BMW's ReachNow and Daimler's Car2Go. Initially, ReachNow's valuation and strategic significance within this venture were minimal due to overlapping customer bases with Car2Go, reliance on outsourced third-party technology, and limited differentiation. Without rapid strategic repositioning, ReachNow risked marginalization in the joint venture.

Action:

As one of the earliest executives involved, I proactively identified an opportunity to transform ReachNow into the strategic technology hub for the joint venture. Over two years, I worked intensively and regularly (approximately every six weeks) with BMW and Daimler boards, executive teams, and global stakeholders in Munich and Berlin, demonstrating strategic technology value, facilitating communication, and aligning interests between BMW and Daimler. Leveraging our substantial redevelopment initiatives (mobility platform and mobile app), my team demonstrated ReachNow's ability to effectively integrate Daimler's vehicles, showcasing impressive capabilities to joint-venture stakeholders. My leadership effectively transitioned ReachNow from a low-value participant into a pivotal technology leader and innovation hub.

Result:

My strategic leadership dramatically increased ReachNow's valuation and positioned its technology as a core strategic asset within the BMW-Daimler joint venture ("Your Now"), significantly enhancing collaboration and strategic alignment between BMW and Daimler. This transformation delivered meaningful improvements in executive communication and coordination, elevating BMW Group's market position within global mobility initiatives. Ultimately, ReachNow's demonstrated capabilities substantially raised its strategic value—estimated at several hundred million dollars—far exceeding initial expectations and solidifying BMW's strong strategic role in the global joint venture.

Strategic R&D Leadership in Autonomous Mobility & Blockchain Security (ReachNow – BMW Group)

Problem:

As part of BMW's global mobility innovation strategy, ReachNow recognized an urgent strategic need to proactively define user experience requirements and operational frameworks for autonomous ride-hailing and car-sharing services. Additionally, the rising significance of security, data privacy, and secure vehicle access within mobility services drove the need to explore cutting-edge blockchain technology for enhanced security and decentralized fleet management. Both autonomous mobility and blockchain security were identified as crucial yet underdeveloped strategic areas, demanding forward-thinking leadership and collaborative exploration.

Action:

I co-led strategic R&D initiatives in close partnership with BMW Group Labs, focusing distinctly on two critical innovation pillars:

- **Autonomous Mobility User Experience (UX)**: Led strategic exploration and definition of comprehensive UX requirements for autonomous vehicles in ride-hailing and car-sharing contexts. This included detailed considerations such as user interactions when summoning autonomous vehicles, seamless passenger recognition, entry and onboarding experiences, luggage accommodation, and overall passenger-vehicle interactions. The work provided foundational guidance for future BMW autonomous vehicle service models.
- **Blockchain-Based Security & Privacy**: Drove strategic investigation into blockchain solutions aimed at significantly enhancing security, privacy, and access control within mobility services. Partnered closely with BMW stakeholders and Munich-based teams to define blockchain applications addressing critical privacy and security challenges specific to fleet and mobility operations.

I regularly traveled to Munich, collaborating extensively with strategic teams, executives, and BMW Group Labs, clearly aligning R&D exploration with BMW's broader global mobility vision and strategic roadmap.

Result:

My strategic leadership effectively defined foundational capabilities and strategic directions in both autonomous mobility UX and blockchain-based security and privacy. Our comprehensive R&D work significantly enhanced BMW's strategic preparedness and positioning, providing a clear roadmap for future autonomous and blockchain-enabled mobility services. These initiatives strengthened BMW's innovation leadership, demonstrating proactive strategic agility, forward-thinking technology readiness, and executive confidence. Ultimately, my co-led R&D initiatives solidified ReachNow's critical role as an influential strategic innovation partner within BMW's global mobility ecosystem.

Ingrooves

Global Platform Re-architecture & Cloud Modernization (INgrooves Music Group)

Problem:

INgrooves operated an approximately 11-year-old monolithic platform that suffered from severe instability, downtime, performance bottlenecks, and complex legacy dependencies. This significantly limited scalability, operational efficiency, and negatively impacted customer satisfaction and retention, ultimately causing the loss of valuable customers. The system struggled with efficiently handling end-to-end music distribution operations, including content ingestion, metadata management, transcoding, scheduling, global distribution, analytics, royalty reconciliation, and payment settlements.

Action:

As the Vice President of Engineering & Product Development, I strategically led a comprehensive global re-architecture initiative. My team migrated the legacy monolithic platform into a modern cloud-native microservices architecture, implementing the company's first major cloud-based technology stack. I spearheaded INgrooves' first DevOps initiative, introducing modern DevOps practices and tools to dramatically improve system reliability, deployment velocity,

and operational scalability. The platform included comprehensive capabilities for secure content ingestion, metadata management, transcoding, advanced scheduling, distribution to major global streaming platforms and e-tailers, real-time analytics, royalty reconciliation, and integrated payment settlements. Throughout this global transformation, I coordinated closely with globally distributed teams and maintained frequent strategic communications with senior executives and board stakeholders.

Result:

The successful modernization and cloud migration significantly reduced operational costs (OpEx) by approximately 32%, inclusive of staffing and infrastructure optimizations. Stability dramatically improved, virtually eliminating downtime and operational disruptions. The transformation reversed previous customer losses, significantly enhanced customer satisfaction, and established a robust, scalable, and reliable platform capable of handling approximately 65% of global music distributions and 30% of global ebook distributions. Strategically, this positioned INgrooves as a leader in global digital content distribution, significantly increasing executive and investor confidence in the company's technology and product capabilities.

Global Engineering & Product Team Unification & Expansion (INgrooves Music Group)

Problem:

INgrooves' global engineering and product teams were fragmented and geographically dispersed, comprising roughly 175 independent contractors across North America, South America, Central America, Europe, Asia, and Eastern Europe. Due to the intensely competitive talent landscape in San Francisco—the corporate headquarters—INgrooves struggled to attract and retain skilled engineering talent. This situation led to inefficient collaboration, inconsistent product delivery, unclear organizational culture, high employee turnover, insufficient oversight, and limited strategic alignment across product and engineering teams.

Action:

As Vice President of Engineering & Product Development, I initiated and led a strategic global transformation of the engineering and product organizations. Recognizing strong talent potential in Victoria, Canada, I opened and significantly expanded a dedicated engineering headquarters there, scaling from a small initial team to approximately 65 engineers locally, supported by an additional 60 engineers globally.

I strategically reorganized the global engineering and product teams into clearly defined verticals aligned with business functions and market segments:

- **Dedicated Major Label Platforms** (e.g., Universal Music Group)
- **Core End-to-End Common Platform** (serving independent labels without internal systems)
- **Platform-as-a-Service (PaaS)** integrations (providing modular platform integrations for customers leveraging internal tools)
- **Dedicated DevOps Team** (cross-functional)
- **Dedicated Quality Assurance (QA) Team** (cross-functional)
- **Comprehensive eBook Digital Supply Chain Platform** (full end-to-end service similar to the music supply chain)

I built a robust senior leadership structure comprising eight directors, a dedicated platform architect, a dedicated DevOps architect, and multiple managers and senior engineering leads. Agile methodologies, robust CI/CD processes, and modern DevOps practices were implemented and integrated throughout the global team structure. Regular training sessions, global workshops, leadership development initiatives, and formal certifications (Scrum, Product Management) fostered a cohesive culture, improved cross-team empathy, and strengthened leadership capabilities across teams. Strategic use of external contractors was limited to specific cases, enabling greater internal skill growth and strategic alignment.

Result:

This organizational transformation resulted in significant operational improvements, including dramatically increased efficiency, improved team collaboration and culture, and substantially enhanced productivity. Employee retention significantly improved—transitioning from prior turnover rates exceeding

50% within two years to exceptionally high retention (approximately 95%+ annually), losing only seven engineers from a stable team of approximately 125 over the following two years.

We successfully created a unified global engineering and product organization, driven by a highly effective and cohesive leadership structure. The integration of dedicated product managers into each team dramatically clarified product vision and strategic alignment. Reduced reliance on external contractors improved strategic control, enabling INgrooves to rapidly innovate and remain a global leader in digital music and ebook distribution.

Platform-as-a-Service (PaaS) Product Suite Development (INgrooves Music Group)

Problem:

INgrooves faced significant challenges managing diverse customer requirements within its global digital music and ebook supply chain operations. Large customers, such as Universal Music Group, demanded dedicated infrastructure and customized solutions, driven by stringent operational and security requirements. Mid-sized labels required flexibility to integrate their existing internal tools seamlessly into INgrooves' systems. Meanwhile, smaller labels and publishers needed robust, end-to-end SaaS solutions. The previous single-platform approach lacked the flexibility, scalability, and differentiation required to efficiently meet diverse customer needs, resulting in onboarding delays, operational complexity, resource contention, customer dissatisfaction, and lost revenue opportunities.

Action:

As Vice President of Engineering & Product Development, I strategically led the creation and implementation of a comprehensive Platform-as-a-Service (PaaS) product suite to address distinct customer segments:

- **Dedicated Major-Label Platforms:**

  Established dedicated, customized platforms for major customers such as Universal Music Group, fulfilling their specific operational, security,

compliance, and performance requirements without co-mingling their data and processes.

- **Flexible Platform Integrations (PaaS):**

  Developed specialized microservice APIs enabling mid-sized labels to seamlessly integrate their existing internal systems (e.g., content management, scheduling, proprietary DRM, royalty processing) into INgrooves' core platform.

- **Fully Integrated SaaS Digital Supply Chain:**

  Delivered a streamlined, end-to-end digital distribution and royalty management solution for independent labels and smaller ebook publishers who lacked internal technology infrastructure.

- **eBook Digital Supply Chain Platform:**

  Established a dedicated, end-to-end digital supply chain specifically optimized for ebook publishers.

I closely collaborated with internal product teams, engineering, customer success, operations, and external stakeholders, carefully defining integration points, managing complex customizations, and strategically allocating dedicated engineering and support resources tailored to each customer segment. Clear separation of platforms allowed efficient handling of distinct operational needs, reducing cross-customer friction and operational disruptions.

Result:

The strategic implementation of this PaaS product suite significantly streamlined customer onboarding, integration, and ongoing operational processes, leading to substantial improvements in customer satisfaction and operational efficiency. By clearly separating platforms according to customer size, requirements, and operational complexity, we effectively isolated demands of high-maintenance customers from smaller labels, resulting in significantly enhanced SLAs, responsiveness, and product innovation tailored precisely to each customer segment.

This flexible, differentiated technology approach significantly strengthened INgrooves' market positioning, clearly distinguishing our offering from competitors. It was instrumental in retaining existing customers, recapturing

previously lost customers, and driving substantial new customer acquisition. Ultimately, these tailored platforms and customized integrations dramatically enhanced INgrooves' competitive advantage, enabling sustained revenue growth and strategic expansion within the global digital music and ebook distribution markets.

Machine Learning for Revenue & Trend Optimization (INgrooves Music Group)

Problem:

INgrooves recognized a significant opportunity to leverage its extensive data generated from managing approximately 65% of global music distribution. While not responding directly to a specific operational problem, we identified a strategic opportunity to productize our data assets to enhance our customers' ability to forecast music streaming trends, revenue performance, and optimize content release strategies. Labels lacked predictive insights, limiting their strategic decision-making around scheduling, marketing, and distribution timing.

Action:

As Vice President of Engineering & Product Development, I strategically led the innovation and implementation of INgrooves' initial machine learning capabilities focused on predictive analytics. I collaborated closely with product owners, data scientists, engineering, and customer success teams to create robust predictive models using variables such as genre, seasonality, competition, geography, and market trends. These insights were provided to customers through intuitive dashboards and actionable data feeds, enabling labels to make informed decisions around content scheduling, release timing, and revenue forecasting. Data was thoroughly anonymized to maintain privacy and security.

Result:

This innovative machine learning capability delivered substantial strategic benefits. Labels experienced increased revenues (approximately 18% uplift) driven by enhanced predictive accuracy around streaming and sales performance. Operational decision-making significantly improved for labels, allowing them to optimize release scheduling and market strategies. Internally, the predictive

insights enhanced our own engineering operations, improving our capacity planning and operational responsiveness. This initiative strongly reinforced INgrooves' competitive positioning as a data-driven industry leader, deepening customer relationships, improving retention through differentiated added value, and strengthening strategic customer stickiness.

Operational Efficiency & Cost Reduction Initiative (INgrooves Music Group)

Problem:

INgrooves faced significant operational challenges, including high costs, inefficient legacy infrastructure, manual processes, and a fragmented global engineering and product team structure. These issues collectively limited scalability, reduced agility, created unpredictable operational outcomes, and increased time-to-market for new product capabilities, impacting overall financial performance and strategic competitiveness.

Action:

As Vice President of Engineering & Product Development, I spearheaded a comprehensive operational efficiency and cost reduction initiative closely tied to our broader engineering reorganization and platform modernization. I led the automation of previously manual processes, consolidated global infrastructure, and introduced microservices architectures and true cloud-native modernization. My teams implemented robust Agile methodologies, rigorous DevOps processes, and operational excellence initiatives. Additionally, we collaborated closely across engineering, operations, finance, sales, customer success teams, and directly with customers, significantly streamlining communication and ensuring strategic alignment at every stage.

Result:

Our focused efficiency and cost-reduction efforts resulted in a remarkable 32% reduction in operating expenses (OpEx). Operational efficiency, scalability, and predictability improved significantly, reducing time-to-market for new capabilities and enabling more accurate planning and execution. Enhanced agility and increased operational predictability strengthened INgrooves' financial

performance, significantly improving profitability and positioning the company strategically for future growth and innovation.

Agile Transformation & Leadership Development (INgrooves Music Group)

Problem:

INgrooves faced significant organizational challenges stemming from globally fragmented engineering and product teams. A lack of structured methodologies, inconsistent project management, and unclear roles led to poor collaboration, operational inefficiencies, unpredictable delivery schedules, and ineffective resource utilization. Morale was low, turnover was high, and cross-functional empathy and understanding were virtually nonexistent. Furthermore, the broader organization—including operations, marketing, sales, and executive teams—had limited understanding of engineering processes and needs, causing friction, misalignment, and inefficiencies.

Action:

As Vice President of Engineering & Product Development, I strategically led a comprehensive Agile transformation across INgrooves. Initially, I engaged a specialized third-party provider to deliver formal Agile training, certifying all engineering and product managers in both Scrum methodologies and product management principles. My intentional decision to cross-train these leaders in both disciplines fostered strong empathy and collaboration between engineering and product teams. Internally, I spearheaded regular Agile workshops, structured ceremonies, implemented Jira and Confluence toolsets, and introduced DevOps and CI/CD practices.

I subsequently extended Agile transformation beyond engineering and product, personally leading extensive Agile training sessions for operations, business units (sales and marketing), and senior executive teams. For the executive leadership team specifically, I collaborated again with the external Agile experts to provide customized executive-level Agile training, ensuring comprehensive organizational understanding, buy-in, and alignment. Additionally, I developed an organization-wide Responsibility Assignment (RACI) framework to clearly define roles,

responsibilities, accountability, and collaboration pathways across all departments.

Result:

The Agile transformation dramatically improved organizational collaboration, predictability, productivity, and operational efficiency. Engineering and product teams consistently delivered on commitments without burnout, significantly improving delivery timelines and quality. Cross-functional empathy and understanding flourished, creating a strong collaborative culture between engineering, product, and the broader organization. Leadership effectiveness increased significantly through clarity of roles and improved collaboration, resulting in dramatically enhanced employee retention, engagement, and satisfaction. The organization gained remarkable operational predictability and strategic alignment, greatly enhancing INgrooves' overall competitiveness, agility, and market positioning as a result of these efforts.

Global Digital Media Platform Transformation (Sony Pictures Digital Entertainment)

Problem:

In the early 2000s, Sony Pictures Digital Entertainment faced significant disruption from emerging digital technologies, changing consumer behavior, and widespread media piracy (e.g., Napster, Scour). Reliance on traditional physical media distribution was limiting Sony's agility, competitiveness, and ability to tap into emerging digital markets. The absence of a secure, scalable digital platform constrained their strategic positioning during a rapidly evolving digital era.

Action:

Initially joining as a Senior Architect and quickly advancing into senior leadership, I spearheaded the comprehensive design and implementation of Sony's pioneering global digital media supply-chain and distribution platform. We developed groundbreaking digital capabilities, including secure master content ingestion, metadata management, rights automation, DRM packaging, transcoding, scheduling, and the first-of-their-kind digital storefronts with multi-channel

distribution and early video and music download and streaming capabilities—preceding major services such as Netflix, YouTube, Apple's iTunes, and Pandora.

Additionally, I established Sony's first comprehensive Service-Oriented Architecture (SOA), creating scalable web services before cloud computing became mainstream. Leveraging economies of scale across Sony Pictures, Sony Music, Sony Electronics, and third-party content publishers, we centralized and streamlined global distribution for web content, video, music, e-books, and gaming assets. I managed cross-functional teams across North America, Europe, and Asia, effectively coordinating global stakeholders and executing complex technology deployments.

Result:

The new digital platform generated more than **$30 million in internal revenue**, effectively creating a new business line from the ground up. While legacy physical media operations remained robust at the time, the digital platform positioned Sony Pictures Digital Entertainment as a pioneering first mover in the emerging digital distribution market. This innovative transformation solidified Sony's reputation for digital innovation and strategic foresight, effectively preparing the company for future growth as digital distribution became mainstream.

North American Enterprise Backbone Services Launch (Qwest Communications International)

Problem:

In the late 1990s, Qwest Communications, primarily a fiber optics provider, needed to rapidly diversify and enhance its enterprise-grade backbone service offerings beyond traditional telecom and basic internet services. The company had acquired third-party enterprise services (Frame Relay, ATM, and IP-based enterprise services), which initially operated at negative revenue, creating operational inefficiencies and lacking competitive positioning in the emerging market. Qwest needed a strategic build-out of advanced enterprise and carrier-oriented data services, voice/video over IP and ATM, and a scalable infrastructure that could capture significant enterprise business from large commercial customers and carrier partnerships.

Action:

Initially joining as a Sales Engineer and quickly promoted to Director of Product Development for Enterprise and Carrier Data Services, I strategically managed the integration of the acquired LCI infrastructure into Qwest's portfolio. I oversaw comprehensive product development, engineering, operations, and support for Frame Relay, ATM, and advanced IP-based enterprise services. Coordinating geographically dispersed teams (engineering in Virginia, operations in Ohio, corporate in Denver), I led significant product and operational innovations, including pioneering ATM and Frame Relay interworking, voice and video services over ATM/IP, and deployment of Quality of Service (QoS) enabled IP services. Additionally, I managed strategic relationships and interconnect agreements with major telecom carriers, including BellSouth, US West, Royal Dutch Telecom, and various SONET interchange deals. I led the build-out of Qwest's first North American data centers and co-led joint venture expansion with Royal Dutch Telecom for seven data centers across Europe.

Result:

My strategic initiatives successfully transformed Qwest's previously loss-leading enterprise and carrier services into a high-performing division, generating over $1 billion in annual revenue by the time I departed. Backbone network traffic increased significantly (over 20%), positioning Qwest as a leader among new-generation telecom carriers. The enterprise-focused innovations significantly improved operational efficiency, reliability, and customer satisfaction, enabling Qwest to capture large-scale commercial contracts and maintain strong, profitable carrier partnerships. Ultimately, these efforts substantially strengthened Qwest's competitive market positioning and financial performance within North America and globally.
